Introducing: Support for retaining supplier location to supplier organization mapping information in catalog subscriptions

Customer challenge

Currently for catalogs imported from supplier location accounts associated with a supplier and supplier organization, the ANID of the supplier organization is used to validate the subscriptions in SAP Ariba Procurement solutions. As the ANID of Supplier location is not taken into account, when users try to punchout, they are directed to the punchout site for the supplier organization and not the supplier location. This would result in purchases from wrong punchout stores.

Solution area

SAP Ariba Catalogs
SAP Ariba Buying
SAP Ariba Buying and Invoicing

Meet that challenge with SAP Ariba

With this feature, when catalogs are imported, the associated supplier location to supplier organization mapping information is retained in SAP Ariba Procurement solutions. This ensures that all catalogs from different supplier subsidiary accounts are associated under the mapped supplier organization.

As a result, users attempting to buy punchout items are directed to the correct punchout site.

Implementation information

This feature is “on” by default.

Experience key benefits

Catalogs from all supplier subsidiaries or locations shall appear under a single supplier organization in the buyer application.

Procurement users using punchout catalogs shall be directed to the correct supplier location’s punchout site to complete the purchase.

Prerequisites and Restrictions

This feature is applicable to suite integrated sites where SAP Ariba Procurement solutions are integrated with SAP Ariba Supplier Management solutions for real-time synchronization of supplier data.

Ensure that the integration of your SAP Ariba Supplier Management solutions with your SAP Ariba Procurement solutions is complete

This feature is applicable only to catalogs obtained from Ariba Network and not to locally imported catalogs.
